COMPLETE CLAIM SET

1. (Previously Presented) A system for processing print jobs in a network

comprising:

a plurality of client stations adapted to submit print jobs, wherein each of the client

stations includes means for generating and submitting a print account job which is generated as a

second print job, the print account job containing account information of a corresponding print

job and linked to the corresponding print job by a linking identifier;

at least one printing device including a control unit and a printer, the control unit

including storage means for storing the print jobs and the corresponding print account jobs

submitted from the client stations to the printing device; and

means for validating the stored print jobs for printing, wherein said validating means

receives the print account jobs and validates a corresponding print job for printing in the case a

valid print account job generated as the second print job has been received.

2. (Previously Presented) The system according to claim 1, wherein the client station

comprises a job submitter including said means for generating and submitting the print account

jobs.

3. (Original) The system according to claim 2, wherein a server station is adapted to

intercept a submitted print job, said server station comprising means for generating and

submitting a print account job containing account information of the intercepted print job,

wherein the print account job is linked to the corresponding print job by a linking identifier.

Application No. 10/780,860 Reply dated February 12, 2010

Reply to Office Action of November 13, 2009

4. (Original) The system according to claim 3, wherein the server station is adapted to

communicate with a client station to obtain account information of the intercepted print job for

insertion in the print account job.

5. (Previously Presented) The system according claim 1, wherein a printer server

comprises said means for validating the stored print jobs for printing, and wherein said validating

means validates a print job by generating a print validation command for a corresponding print

job and submitting the print validation command to the printing device.

6. (Previously Presented) The system according to claim 1, wherein the control unit of the

printing device is adapted to receive the print jobs and the corresponding print account jobs, and

wherein said validating means are part of the control unit of the printing device.

7. (Previously Presented) The system according to claim 6, wherein the storage means

includes a holding queue, a printing queue and an account log file, and wherein the control unit

moves the validated print job from the holding queue to the printing queue to be printed and

moves the print account job to the account log file in the case the valid print account job has

3

been received.

8. (Previously Presented) A printing device, comprising:

a control unit; and

a printer,

wherein the control unit is adapted to receive a print job, and a corresponding print

account job generated as a second print job, the control unit including:

storage means for storing the print job and the corresponding print account job in

a holding queue;

means for validating the stored print job for printing, said validating means being

adapted to receive the corresponding print account job and validate the print job for printing in

case the corresponding print account job generated as the second print job is valid.

9. (Previously Presented) The printing device according to claim 8, wherein the storage

means further includes a printing queue and an account log file, and wherein the control unit

moves the validated print job from the holding queue to the printing queue to be printed and

moves the corresponding print account job to the account log file in the case the corresponding

print account job is valid.

10. (Original) A client station for use in a system for processing print jobs according to

claim 1, the client station being adapted to submit print jobs, wherein a job submitter is provided,

including means for generating and submitting a print account job containing account

information of a print job, the print account job being linked to the corresponding print job by a

4

linking identifier.

11. (Original) A server station for use in a system according to claim 1, wherein the

server station is adapted to intercept a submitted print job, the server station comprising means

for generating and submitting a print account job containing account information of the

intercepted print job, wherein the print account job is linked to the corresponding print job by a

linking identifier.

12. (Original) The server station according to claim 11, which is adapted to communicate

with a client station to obtain account information of the intercepted print job for insertion in the

print account job.

13. (Original) A printer server for use in a system according to claim 1, including means

for validating stored print jobs for printing, wherein the validating means validates a print job by

generating a print validation command for a corresponding print job and submitting the print

validation command to a printing device.

14. (Previously Presented) A computer program embodied on a computer-readable

medium comprising program instructions for a computer to operate as a client station in the

system of claim 1 when said program runs on the computer.

15. (Previously Presented) A computer program embodied on a computer-readable

medium comprising program instructions for a computer to operate as a control unit of the

5

printing device in the system of claim 1 when said program runs on the computer.

16. (Previously Presented) A computer program embodied on a computer-readable

medium comprising program instructions for directing a computer to operate as a server station

in the system of claim 1 when said program runs on the computer.

17. (Previously Presented) A computer program embodied on a computer-readable

medium comprising program instructions for directing a computer to operate as a printer server

in the system of claim 1 when said program runs on the computer.

18. (Previously Presented) The system according to claim 1, wherein the linking

identifier is a job name in a job name field of the second print job.

19. (Previously Presented) The printing device according to claim 8, wherein the

corresponding print account job contains account information of the print job and is linked to the

print jobs by a linking identifier, and the linking identifier is a job name in a job name field of

6

the second print job.
